a) What is an interface?
An interface looks like a class but is not a class, this interface is used to specify a behavior that classes must implement. Just like in abstract classes an interfaces specifies behaviors but not the implementation.

b) Discuss the property of containing only methods protocol declaration without behavior.
Can be used to define certain criteria on the behavior of objects without going into details.

c) Can you create object directly from interfaces?
if not, why? No, cause its only generalized, not specific

Well done!

About the feedback received, I haven't anything to say. I think that is good to have feedback every now and then.

As I said in the past report , I think feedback is one of the most important things in everyday life, even if it isn't what you expect it to be, that is its meaning, saying what things you are doing right and what you aren't.
